## Colorizing History

The picture records the fifth moment of human success on the moon, and three astronauts are driving a lunar rover to tour the Cartesian Heights. The mission was called Apollo 16. The successful landing on April 21, 1972, and the successful return on April 27, 1972. The three astronauts who performed the mission were Commander John Young, Commander Pilot Ken Mattingly, and Lunar Pilot Charles Duke. This was a mission to the moon, and the three astronauts not only brought back 200 pounds of moon rocks from the moon, but also spent 71 hours on the moon, setting a world record.

This photo was taken by a Hasselblad film camera. Encountered magical things in this mission. When the Apollo 16 spacecraft was about to return from the moon, three astronauts captured images of the alien spacecraft, and the enhanced object graphics were described as "dish-shaped objects with a dome". Until 2007, a team led by Gregory Byrne of the Image Science and Analysis Group at the Johnson Space Center completed a report on the unknown object. They first used a copy of the image data, and later performed a high-resolution digital scan of the original image to analyze the details. The result was "the object in the film shot by Apollo 16 is the astronaut floodlight and its Cantilever. There is no evidence of other possibilities in the photo records. "This incident itself is a small oolong, but it is also because of the growing power of science and technology that we can go further from the truth.

There is also an interesting thing in this mission, when astronaut Charles Duke did the last mission on the moon, he put a photo of his family portrait on the moon surface. Now that photo is lying there quietly, only a few inches away from the footprints of astronaut Charles Duke. When you browse my article, this photo has been on the moon for half a full 40 years.

Fifty years ago, American astronaut Armstrong became the first human to land on the moon. The famous phrase "a small step for individuals, a big step for humans" has inspired generations. The moon landing represents human desire for the mystery of the universe, and represents the spirit of human exploration of new things. With the rapid development of science and technology, I believe that when humans face the universe again, what they explore will be more exciting and meaningful.

This photo does not follow the rules of composition, it is just a photo to witness the historical moment, and was taken on April 27, 1972.
